FS i-LINK

FS i-LINK

SUPERVISION, CONTROL, TELESERVICE

The electronic controllers of Frigosystem's latest generation units have an excellent outwards connectivity and their program flexibility can match that of the most demanding applications.

FS i-LINK is a modern supervising system, able to monitor the FRIGOSYSTEM refrigeration and thermoregulation units even when composed of several different units.

The powerful platform together with internal Web Server allows an efficient local or remote telecontrol: the special connectivity module "FS i-Link" enables the operator to connect from any web position and check the machine status, change the parameters and manage the alarms.

The main functions of the supervising module are:

- View and print temperatures, alarms, pressures, working status
- Remotely modify all functioning parameters
- Manage all anomalies through alarms reset function

FS i-LINK is supplied on request by FRIGOSYSTEM, who is also the owner of the hardware and software.

The system has the capability to be connected through Ethernet cable to an intranet-internet web, or to other programs for the management of distributed applications.

The hardware is also equipped with a serial RS485 slave output, and with a USB port for download of parameters, data logger/alarms and upload of updates.

It can also be connected to OPC-UA systems through the integration of the dedicated communication module.

This important device can also establish a virtual connection with the Frigosystem service centre or its local service points to check, virtually and in real time, the performance of Frigosystem units wherever they are installed in the world, and provide the operator some fundamental indications about functioning and maintenance.
